## AMENDMENT TO CLAIMS:

## Claims:

- 1. (original) A co-axial, multi-rotor wind turbine having:
  - a bearing;
  - a driveshaft, supported by said bearing;
  - a downwind projecting section of said driveshaft having rotors attached at spaced intervals;
  - a load;
  - a pivot point;

wherein said load is located forward of said pivot point, so that said load acts as a counterweight, serving to at least partially counterbalance said downwind projecting section of said driveshaft and said attached rotors, about said pivot point.

- 2. (original) The wind turbine of claim 1 further having an upwind projecting section of said driveshaft.
- 3. (original) The wind turbine of claim 2 wherein said upwind projecting section of said driveshaft has at least one rotor attached to it.
- 4. (original) The wind turbine of claim 3 wherein said at least one rotor comprises rotors attached at spaced intervals to said upwind section of said driveshaft.
- 5. (original) The wind turbine of claim 1, further comprising a bearing support means, wherein said load is supported by said bearing support means.
- 6. (original) The wind turbine of claim 1, further comprising a brake located upwind of said pivot point, wherein said brake acts as a counterweight, serving to help elevate said downwind section of said driveshaft.
- 7. (original) The wind turbine of claim 2 wherein said load is supported by said upwind section of said driveshaft.
- 8. (original) The wind turbine of claim 1, further comprising a dedicated counterweight located upwind of said pivot point, wherein said counterweight serves to help elevate said downwind section of said driveshaft.
- 9. (currently amended) A co-axial, multi-rotor wind turbine having a counterweight forward of a pivot point, at least part of said counterweight not co-rotating with said turbine, said

- counterweight serving to at least partially counterbalance a downwind section of a driveshaft and its attached rotors.
- 10. (original) The wind turbine of claim 9 wherein said counterweight comprises a load.
- 11. (original) The wind turbine of claim 9, further locating a brake forward of a pivot point, so that said brake can serve as an additional counterweight.
- 12. (original) The wind turbine of claim 9, further locating a support frame substantially forward of a pivot point, so that said support frame can serve as an additional counterweight.
- 13. (original) The wind turbine of claim 9, further locating a dedicated counterweight forward of a pivot point, so that said dedicated counterweight can serve as an additional counterweight.
- 14. (original) The wind turbine of claim 9, further comprising a guy wire that serves to help elevate the downwind section of the driveshaft.
- 15. (original) The wind turbine of claim 13, further comprising a boom to help support said guy wire in an effective position.
- 16. (original) The wind turbine of claim 9, further comprising a truss structure that serves to help elevate the downwind section of said driveshaft.
- 17. (original) The wind turbine of claim 9, further comprising a lifting body that serves to help elevate the downwind section of said driveshaft.
- 18. (original) The wind turbine of claim 17, wherein said lifting body functions by means of aerodynamic lift.
- 19. (original) The wind turbine of claim 17, wherein said lifting body functions by means of buoyant lift, through the use of a buoyant gas.
- 20. (currently amended) A coaxial, multirotor wind turbine having a downwind section of a driveshaft, wherein massive <u>nonrotating</u> components of said wind turbine are located upwind of a structural attachment point, said massive components serving to counterbalance said downwind section of said driveshaft about said structural attachment point.
